# The biggest difference between RMarkdown and Microsoft Word

The things you would normally do by **clicking around**, you now do through **codes**.

Yang Liu, PhD

What is  
RMarkdown?

**Why?**

How does it  
work?

YAML

Text

Code Chunks

Piecing Things  
Together

Additional  
Resources

Why?

# Why?

- 1 It is dynamic.

What you **see**:

If the radius of a circle is 2, then the area of the circle is 12.57.

What you **type**:

```
```${r circle}  
radius = 2  
```
```

If the radius of a circle is ``r radius``, then the area of the circle is ``r round(pi*radius*radius, 2)``.

# Why?

What is  
RMarkdown?

Why?

How does it  
work?

YAML  
Text  
Code Chunks

Piecing Things  
Together

Additional  
Resources

- 1 It is dyanmic.
- 2 It is flexible:

## Code Accepted:

- R
- Python
- Bash
- Rcpp
- Stan
- JavaScript
- CSS

## Output Types:

- PDF
- html
- Word
- Powerpoint
- Many more...

# Why?

- 1 It is dynamic
- 2 It is flexible.
- 3 It plays well with GitHub:

| 68   | 68 |                              |   |         |   |   |                                      |
| 69   |    |                              |   |         | RStudio provides many tools to make your day-to-day use of git as easy as possible. However, there are a huge number of git commands, and they're not at all available in the IDE. That means you'll need to run a handful of commands from a shell (aka a console), especially when you're setting up, dealing with merge conflicts and getting out of jams. The easiest way to get to a shell is Tools > Shell.   |   |                                      |

The **YAML** (YAML Ain't Markup Language) section is often on the very top of a RMarkdown document. It is essentially the **metadata**, describing the overall environment the document is working in.

Now in your RStudio, go to

File -> New File -> R Markdown... ->  
Document -> PDF -> OK.

# You just made a YAML section!

```
---  
title: "Untitled"  
author: "Yang Liu"  
date: "14 November 2019"  
output: beamer_presentation  
---
```

`output:` is used to specify the output file type. - PDF = `pdf_document`  
- html = `html_document` - Word = `word_document` -  
Powerpoint = `powerpoint_presentation` - PDF  
Presentation = `beamer_presentation`

# What else can go here?

- **Page setup:** font type/ sizes, margin sizes, theme/ colour scheme...;
- **Other formmating setups:** image sizes/ locations...;
- **Document components and their settings:** table of contents, references/ bibliographies...

# Now that you've got your first . Rmd

Compared to an R Script Window, a markdown document source window:

- **Does not** have the “Source on Save” tick box or the “Source” button;
- **Does not** have the “Code Tools” button;
- **Does not** have the “Compile Report” button;
- Now have the option to insert code chunks and run code chunks separately;
- Now have the option to move around sections;
- Now have the option to publish to the web.

## Example: Working with fonts

What you **see**:

**April** is the *cruellest* month,  
breeding lilacs out of the dead land, mixing memory and desire,  
stirring dull  $\sqrt{roots}$  with **spring rain**.

What you **type**:

```
**April** is the _cruellest month_,  
~~breeding lilacs out of the dead land,~~  
mixing `memory` and `desire`,  
stirring dull `$\sqrt{roots}$` with  
\textcolor{blue}{spring rain}.
```

## Example: Working with lists

What you **see**:

April is the cruellest  
month,

- breeding lilacs out of  
the dead land,
- mixing memory and  
desire,
  - stirring dull roots  
with bluespring  
rain.

What you **type**:

```
April is the cruellest  
month,  
+ breeding lilacs out of  
the dead land,  
+ mixing memory and desire,  
  - stirring dull roots  
with blue spring rain.
```

# Text: Working with images

What you **see**:

**Code Chunks**

Piecing Things  
Together

Additional  
Resources

## Code Chunks

# Code Chunk

Additionally, blocks of codes can actually be included as a part of your RMarkdown file (. rmd). In between your writing, a code chunk may look like the following:

```
```${r}  
plot(things)  
```
```

After which, you can resume writing.

# Code Chunks

But when would we need this?

- Print
- Data
- Tables (e.g., model output)
- Plots
- Demonstrate Methods

# What if we want to print stuff?

- We would like our codes to run in silence.
- We would like the results of the codes to be included in the document.

# And how do we do that?

Options we'll need here are:

- `echo`: when set to `T`, display code in output document.
- `eval`: when set to `T`, run code in chunk.

## Example: Print Mode Output

What you **see**:

| term        | estimate   | std.error | statistic | p.value |
|-------------|------------|-----------|-----------|---------|
| (Intercept) | 53.9555609 | 0.3149949 | 171.29025 | 0       |
| gdpPercap   | 0.0007649  | 0.0000258 | 29.65766  | 0       |

What you **type**:

```
```{r echo = F, eval = T}  
data <- gapminder::gapminder  
kable(broom::tidy(lm(data = data,  
lifeExp~gdpPercap)))  
```
```

## Example: Print scatter plot

What you **see**:

What you **type**:

```
` `{r echo = F, eval = T, fig.height = 1}
ggplot(data, aes(x = gdpPercap,
y = lifeExp)) +
geom_point() +
labs(x = "GDPpc",
y = "lifeExp")
` ` `
```

# What if we want to demonstrate stuff?

What is  
RMarkdown?

Why?

How does it  
work?

YAML

Text

Code Chunks

Piecing Things  
Together

Additional  
Resources

- We would like our codes to appear in text without being ran.
- We don't really care about the results in this case.

## Example: Demonstrate through codes

What you **see**:

```
ggplot(data, aes(x = gdpPercap,  
                  y = lifeExp)) +  
  geom_point() +  
  labs(x = "GDPpc",  
        y = "lifeExp")
```

What you **type**:

```
```{r echo = T, eval = F}  
ggplot(data, aes(x = gdpPercap,  
y = lifeExp)) +  
geom_point() +  
labs(x = "GDPpc",  
y = "lifeExp")  
```
```

# RMarkdown Engine

We mentioned that RMarkdown can handle more than just R. We can specify the type of language of a specific code chunk is ran in:

**Conditioned on You already have a version of Python installed locally, what you see:**

## 2

What you **type**:

```
` ``{python echo = F}  
1+1  
` ``
```

# Piecing Things Together

# Generating output

- 1 Press the Knit button in the Source window.
- 2 render function, i.e.,  
`rmarkdown::render("XXXX.Rmd")`
